

ATELIER

VISUAL IDENTITY / BRAND BIBLE

A system for distinct parts coming together.

2026 / IDENTITY V1.3

Pieces in place.

The identity is an act of assembly, not a picture of a tool.

Atelier makes complex asset work legible. Texture, mesh and material are separate things; their relationship becomes visible when they approach, align and click into place.

01 **Three parts, one intention.**
Each piece keeps its own silhouette. They meet; they never merge.

02 **Colour means asset type, until there’s a verdict.**
Blue, teal and copper name things. Only an outcome recolours the pieces, and only in the status glyph.

03 **Motion reports the truth.**
The pieces form the A only when a real event confirms success, never at the end of a timer.

ASSEMBLY FIRST. LETTER SECOND.

The three-piece mark

Each shape has one job, one colour and its own unbroken silhouette.

01 Texture

Rounded tile with a notch at its top left, a vertical back and a face that leans towards the mesh. Carries the weight.

Holds its seat while the others close in.

02 Mesh

Block leaning towards the tile, its two inner edges parallel. Gives direction.

Comes in last, from the upper right, and makes the click.

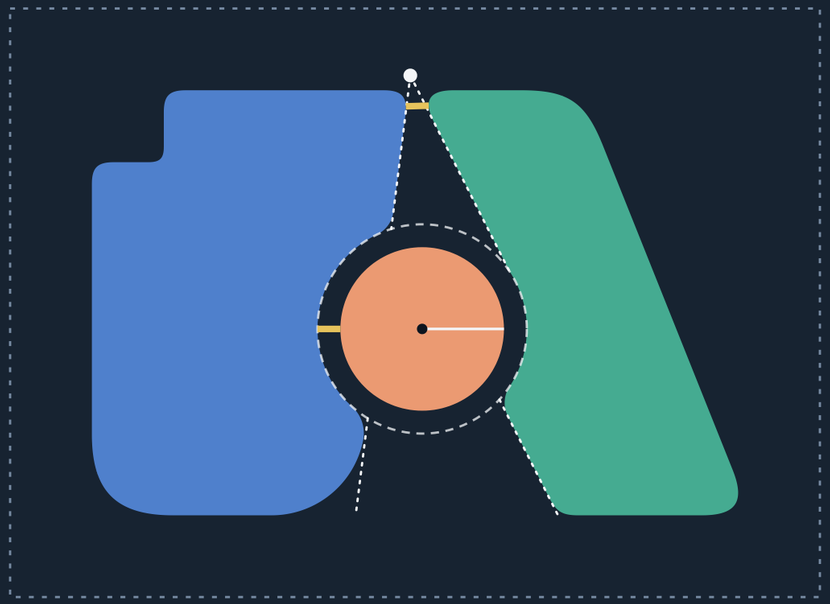

03 Material

A perfect circle seated in both bites. Touches nothing.

Settles into the bites as the A closes.

An A you discover

The A lives in the leaning edges and the gap at the top, never in an outline or a crossbar.

DASHED BOX = CLEARSPACE (r ON EVERY SIDE)

Construction

HEIGHT	H = 260u	Master grid. Everything below is in these units.
DISC	r = 50u	The unit of clearspace.
GAP	g = 14u	Round the disc, and between tile and mesh at the top.
BITES	R = r + g = 64u	Both concentric with the disc.
NOTCH	44 × 44u	The tile's top left.
CORNERS	k = 7–40u	Eased: each turns gradually into its curve.
LIPS	f = 18–22u	Tangent arcs where a bite meets a straight edge.
TILE LEAN	7.081°	The face only; the back stays vertical.
MESH LEAN	26.8°	Both inner edges, parallel. The outer edge is 21.8°.

Extended, the tile's face and the mesh's upper inner edge meet 9u above the mark: that apex is the implied A. The lean isn't chosen; it's solved so the tile's top corner sits exactly g from the mesh. If a bite isn't concentric with the disc, or any gap varies, the mark is wrong. Don't adjust it by eye.

Rich, softened colour

Not pastel. Not neon. Flat opaque fills on a dark neutral canvas, spread in lightness so they stay apart in grey.

TEXTURE / BLUE

#4F80CC

Category colour. Textures only. L* 53.

MESH / TEAL

#45AB91

Category colour. Meshes only. L* 64.

MATERIAL / COPPER

#EB9A72

Category colour. Materials only. L* 71.

CHARCOAL #0D151F

Canvas. Ink on light UI.

SURFACE #172331

Cards and panels.

PAPER #F4F6F8

Primary text. Light canvas.

MIST #B4C0CE

Body text and captions on dark. 9.9:1.

GUIDE #778BA3

Rules and quiet icons. Never text.

Colour has one job each

Category colours say what something is. Status colours say how it ended. A status colour can take over the glyph, but only after the shape has already said it.

CATEGORY: WHAT IT IS

Texture Asset dots, legends, the mark.	4.6 : 1
Mesh Asset dots, legends, the mark.	6.5 : 1
Material Asset dots, legends, the mark.	8.2 : 1

Never on buttons or links. On a progress bar, only as the material disc itself. Always on the app icon, lockups and static mark.

STATUS: WHAT IS HAPPENING

Working Mist #B4C0CE The sentence in Mist. Pieces keep their category colours while they work.	9.9 : 1
Complete Green #B6EBA8 Hue 107°, well clear of mesh teal (165°). The A turns green, then back.	13.5 : 1
Warning Amber #E6C35C Hue 45°, clear of copper (20°). The whole ! turns amber.	10.8 : 1
Error Rose #EC6A86 Hue 347°, cooler than copper. The whole X turns rose.	6.1 : 1

Status always ships as icon + sentence + colour. Colour is the third cue, not the first.

Contrast measured against Charcoal #0D151F. On Surface #172331 every pair stays at or above 4.5 : 1 except the blue (4.0 : 1), so thin texture icons in dark UI take #6B95D4.

Quiet typography, confident geometry

One family: Inter, with Inter Display for large sizes. Only uppercase labels get letter-spacing.

ATELIER

WORDMARK. OUTLINED, NEVER TYPED

Inter Display SemiBold at +110 tracking, converted to outlines. The A is a crossbarless Λ with the material disc where the crossbar would be: the wordmark's single custom move, and it repeats the mark's idea. Minimum size: 12px cap height. Below that, use the mark alone.

DISPLAY
Inter Display SemiBold · 40–64px · lh 1.05 · −1.2%

Build a better asset.

HEADING
Inter SemiBold · 20–28px · lh 1.2 · 0

Matching mesh to texture

BODY
Inter Regular · 15–17px · lh 1.5 · 0

Asset materials are ready to export. Bindings were preserved for all three assets.

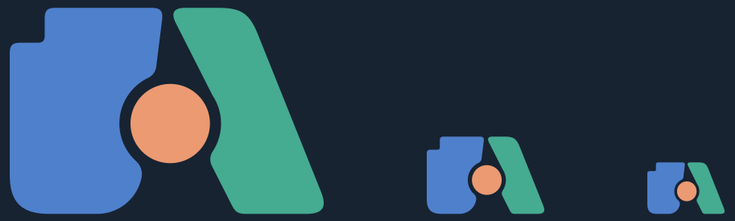

LABEL
Inter SemiBold, uppercase · 11–13px · +9%

TEXTURES / MESHES / MATERIALS

Built to survive 16px

Two drawings of the same mark. Use the master at 32px and above, and the small mark below 32px.

MASTER: 32PX AND UP

128PX 48PX 32PX

g = 14u, r = 50u, lips 18–22u. At 16px the gap becomes 0.9px and closes up.

SMALL: UNDER 32PX

64PX 24PX 16PX

g = 32u, r = 40u, lean 3.921°, lips 20–24u. Gaps stay a full 2px at 16px.

16PX, ENLARGED 5×

MASTER SMALL

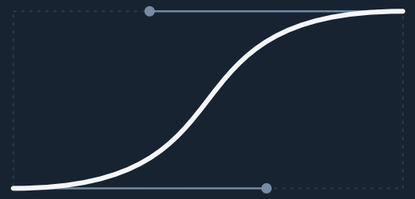

Enlarged from real 16px renders. In the master the gap drops below a pixel and the disc smears into the tile edge. The small mark keeps a clean dark ring round the disc.

Approach. Click. Settle.

How the pieces fit on a confirmed success, in about a second. Bring them in, wind up, hit hard, let it ring. The green arrives on contact.

01 — 340ms

To the seats

`cubic-bezier(0.65, 0, 0.35, 1)`

All three together: tile to its seat, disc 8u right of its seat, mesh 46u right and 60u up.

02 — 110ms

Mesh in

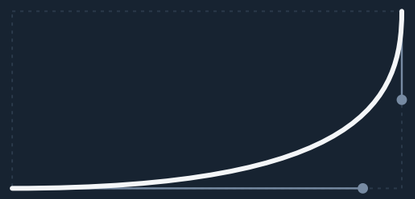

`cubic-bezier(0.16, 1, 0.3, 1)`

The mesh comes to 16u right of its seat, already wound up. The disc waits.

03 — 80ms

Snap

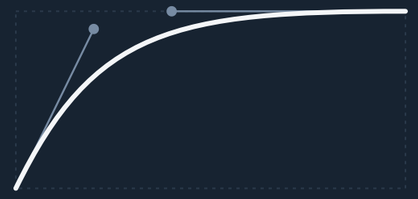

`cubic-bezier(0.9, 0, 1, 0.5)`

The mesh presses 3u past its seat as the disc seats. Only a confirmed success triggers this.

04 — 240ms

Recoil + rest

`cubic-bezier(0.2, 0.9, 0.4, 1)`

Back to 1u out of the seat (110ms), then ease home (130ms). One rebound, never two.

On contact: the disc squashes to 0.88 × 1.12 and springs back (300ms). The glyph punches to 104.5% (70ms out, 260ms back). A green ripple leaves the disc (620ms). Green spreads outwards: disc, tile +60ms, mesh +120ms, 220ms each; 160ms after the effects, the A returns to its own colours (380ms). Optional sound: tick, thump, two-note chime.

Reduced motion: no travel, punch or ripple. The glyph cross-fades to each state's pose (150ms out, 150ms in), the only fade the system allows. Complete still turns green, then returns. The icon and text carry the rest.

The animation cannot lie

The pieces only take a meaningful shape when a real build, import or export event arrives. Until then they keep trying.

Working

The pieces keep trying to fit: dock, test the fit, tap, hold, then try another. A known asset type gets its own loader.

Never A, ! or X. Never a percentage unless it’s measured.

Complete

All three come in together, then the hard snap, squash, punch and ripple, with green spreading from the disc. Then the A takes back its colours.

The only state that forms the A.

Warning

A balancing act: disc down as the dot, mesh stood on it, tile set on top slightly off-centre. Turns amber, catches its balance, keeps wobbling.

Always paired with the specific warning text.

Error

Tile and mesh flatten into bars and cross over each other at ±42°; the disc pins them. Clamps shut, turns rose.

No shaking. No particles. Always say why.

WRONG FITS

HEAD

BENCH

RAMP

AT REST

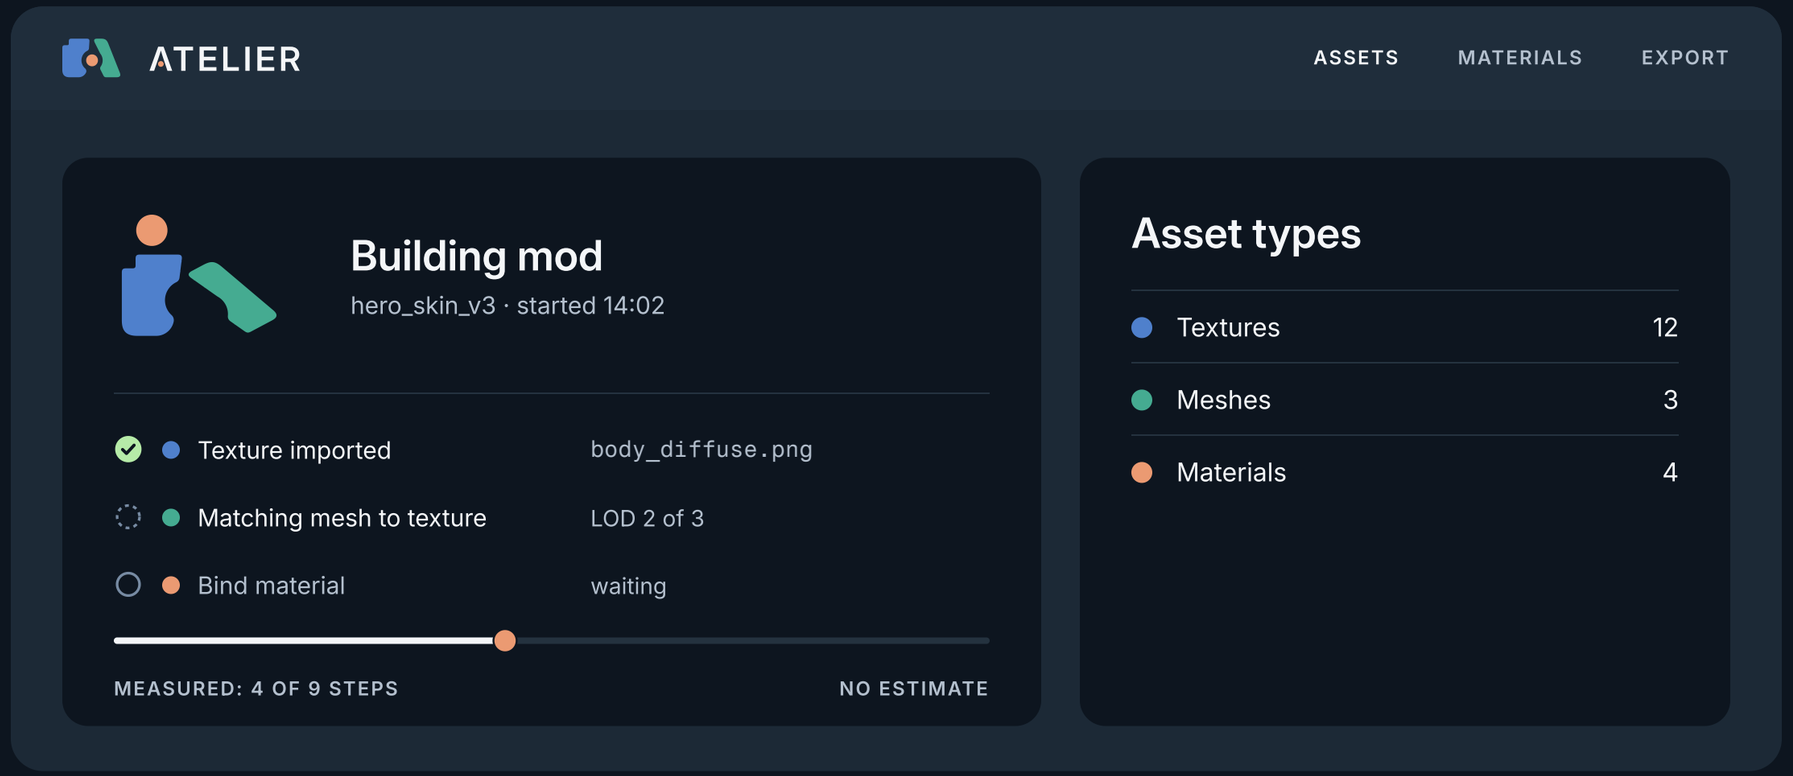

ROW

Physical, never faded. Pieces move one at a time on planned curves that keep a 14u gap. Layer order is fixed (tile back, mesh middle, disc front), so nothing re-stacks. A move is never cut off.

An identity that knows when to stop

Interface chrome stays neutral. Colour appears only where it names an asset type; progress is Paper on Surface, pushed by the copper disc.

COLOURED DOTS

Asset type only. Every stage row says what it's working on.

STATUS ICONS

Neutral shapes for state: done, working, waiting.

PROGRESS BAR

Paper on a quiet track, rolled forward by the material disc. Only for counted steps; with nothing to count, there's no bar, only the working glyph.

One system, many surfaces

Dark is preferred and light is supported. The mark never changes colour; only the canvas and the wordmark ink do.

APP ICON / DARK

APP ICON / LIGHT

SMALL MARK / FAVICON & AVATAR

Horizontal lockup: mark height = 2.7 × wordmark cap height, gap = 1.3 × cap height. The app icon is the master on Charcoal at 48px and up, and the small mark in the 16, 24 and 32px frames.

Clear, capable, never ornamental

Atelier speaks like a useful creative tool, not a tech manifesto. Say what happened, to which asset, and what to do next.

CLEAR

- ✓ Build complete. Three assets exported.
- ✗ ~~Woohoo! Your masterpiece is ready ✨~~

SPECIFIC

- ✓ Texture imported. Material binding preserved.
- ✗ ~~Everything looks good!~~

HELPFUL

- ✓ Mesh could not be read. Check hero_body.fbx exists and isn’t locked.
- ✗ ~~Oops, something went wrong.~~

RESTRAINED

- ✓ Exports to four formats.
- ✗ ~~Revolutionary creative synergy.~~

MESSAGE PATTERN

What happened → To which asset → What to do next

Drop the third part when there’s nothing to do. Never drop the second.

What to protect

Consistency comes from constraints, not from repeating decorative motifs.

KEEP

- Three opaque pieces, each with a 14u halo
- Bites concentric with the disc, every gap exactly g
- The small mark below 32px
- Category colours on the app icon, lockups and static mark
- The A only on a confirmed success event
- Shape first, then status colour; the sentence says it at once

AVOID

- Fades, dissolves or re-stacking layers
- Status colours on the brand mark outside the status glyph
- Working poses that look like A, ! or X
- Gradients, bevels, glow, wireframes, cubes, batteries
- Letter-spacing on lowercase text
- A timed loop standing in for progress

From system to application

A production handoff needs working behaviour, not just lovely screenshots.

01 **Freeze the mark**

Canonical assets: `atelier-mark.svg`, `atelier-mark-small.svg`, `atelier-wordmark.svg`, generated by `scripts/brand_mark.py`. Regenerate; never redraw or retype.

02 **Wire the states**

Work until an event arrives, then success → A + green, warning → !, error → X. The reference is `docs/motion-v2/SPEC.md`.

03 **Test the scales**

16, 24, 48 and 128px in dark and light. Confirm the switch to the small mark below 32px.

04 **Verify accessibility**

Text pairs ≥ 4.5 : 1 (page 06), the reduced-motion path, a 2px Paper focus ring with 2px offset, status never by colour alone.

CHANGED IN V1.3

- The mark redrawn: a notched tile whose face leans until it sits one halo from the mesh, so the A's apex closes to 9u above the mark
- Corners ease into their curves; the mesh's inner edges run parallel
- Piece colours spread in lightness: #4F80CC, #45AB91, #EB9A72
- Complete green lifts to #B6EBA8, well apart from copper for colour-blind viewers; the A returns to its colours after the click
- Complete brings all three in together; three wrong fits (Head, Bench, Ramp), a row at rest and per-asset loaders
- Small mark below 32px; Guide never colours text
- v1.2: wrong fits, the heavier click, the ! and X, fixed layer order. v1.1: grid, small mark, Inter, status split from category
